

R'ıyo

Where do Türkiye's hazardous cargoes go — and who's behind them? A 2022 deep-dive into hazardous cargo handling across Turkish ports, by the *R'ıyo* team.

Hazardous cargo · 2022 17 port authorities ~183 companies 1 cyan threshold

The project

Turkish ports moved tens of millions of tons of hazardous cargo in 2022 — fertilizers, fuels, chemicals, LPG, crude oil. We took the [Directorate General for Maritime Affairs](#) operational dataset for that year and asked three questions:

1. **Where** is hazardous cargo concentrated geographically?
2. **Who** are the dominant handlers — and how skewed is the distribution?
3. **What** would happen if Türkiye taxed companies that exceeded a 20,000-ton threshold?

Our group name **R'ıyo** is a nod to *Manifest's* “Ariyo” — in Turkish the letter *R* reads “ar”, so *R'ıyo* = *Ariyo*. Six members, six energies, one dataset.

Meet the team

You can find each of us on our personal pages — head to [the Team page](#) for the full intros, or jump straight to a profile below.

Key takeaways

- Hazardous cargo handling in 2022 totaled **~109 million metric tons** across **17 port authorities**, **69 facilities** and **180 receiver companies** — a small slice of firms handles a wildly disproportionate share.
- The **Aliğa-İzmir corridor** and **Ceyhan** lead by a wide margin, driven by refining and crude-oil terminals; the Eastern Mediterranean and South Marmara coasts form a clear secondary band.
- The distribution of company-level tonnage is **strongly right-skewed** even on a log axis — a handful of giants extend far past 10 tons while most receivers cluster in the 10^3 – 10^4 range.
- **Six in ten companies (107 of 180)** cross the 20,000-ton policy threshold — and together they carry **~99.5%** of all hazardous tonnage. The policy net is wide by headcount but **extremely top-heavy** in actual liability.
- A simple hypothetical levy of **50 per ton** on threshold-exceeding companies would raise about **5.4 billion** in annual revenue — with the **top ten handlers alone** contributing the majority of that bill.

What's next

- The [Data](#) page documents the dataset, source, preprocessing, and link to the cleaned `.RData`.
- The [Analysis](#) page is the main read — Türkiye choropleth, company distribution, and the 20,000-ton tax simulation.
- The [Team](#) page introduces each of us with our Manifest alter ego.
